DIGITAL LITERACY PROJECT REPORT

Name: Vaibhav Singhal

Registration Number: 25BCE10957

Branch: B.Tech Computer Science Engineering

Year: First Year

Course Code: CSE0001

Course Title: Digital Literacy

University: VIT Bhopal University

INTRODUCTION

This Digital Literacy project was given to help students understand the importance of digital skills in modern education. Today, students use technology for studying, communication and project work, so it is important to know how to use digital tools effectively and safely.

In this project I completed five tasks which included creating a digital literacy infographic, building a digital portfolio, exploring coding platforms, writing professional emails and learning about cybercrime awareness. These tasks helped me understand how digital platforms can be useful for academic growth and professional development.

Through this project I also learned about online safety, professional communication and responsible use of technology. Overall, this project improved my digital knowledge and helped me understand how important digital literacy is for every student.

Task 1 write- up

In Task 1, I created a Digital Literacy infographic using Canva. Canva is an online design tool which provides ready-made templates for creating posters and infographics. I selected this tool because it is easy to use and suitable for beginners.

In my infographic I included topics such as the meaning of digital literacy, useful digital tools for students, internet safety practices and professional online behaviour. I added points about using strong passwords, avoiding suspicious links and maintaining a professional online presence.

The most interesting part of this task was designing the layout and selecting icons to make the infographic visually attractive. The difficult part was selecting important information because digital literacy is a broad topic.

This task helped me improve my creativity and presentation skills. I also understood how visual content can help in spreading awareness effectively.

TASK 2 write-up

In Task 2, I created my digital portfolio on GitHub, LinkedIn and Kaggle. These platforms help students build a professional profile and showcase their learning progress.

On GitHub I created my profile and learned how projects can be uploaded and managed. On LinkedIn I added my education details which will help me build a professional identity. On Kaggle, I also made up my profile.

In the coming years, I plan to upload more projects on GitHub and regularly practice coding problems to improve my programming skills. I also plan to use LinkedIn to build professional connections which may help during internships.

This task made me realize that building a professional profile from the first year is very important for career growth.

TASK 3 write -up

In this task, I solved a beginner problem on HackerRank. It was a simple problem but it helped me understand how coding platforms work. These platforms are useful to improve logic building and programming practice.

I also created a Google Form quiz based on digital literacy. It had five questions including multiple choice and short answers. This helped me learn how Google Forms can be used for surveys and quizzes.

These tools will help me in academics because coding platforms improve problem solving ability and Google tools help in collaboration. This task also increased my confidence in using online learning platforms.

TASK-4 write up

In this task I learned how to write formal emails properly. Earlier I did not know that subject line and proper greeting is very important. After doing this task I understood how to write emails in professional way.

I also made a social media do's and don'ts list. Sometimes students post things without thinking which may create problems later. For example posting wrong information or using bad language can affect digital image.

From this task I learned that we should always communicate politely and think before posting anything online.

TASK-5 write up

For this final task, I researched UPI payment frauds. The thing that surprised me most was how incredibly simple but psychologically effective the "QR code receive money" scam is. Even as a CSE student who builds web apps and understands how digital transactions work, it's easy to see how a scammer creating a fake sense of urgency could trick someone into entering their UPI PIN in a panic.

As a result of this research, I'm changing one major habit: I will completely stop relying on payment screenshots shown by other people. From now on, whether I'm splitting a bill at the canteen or selling an old textbook, I will only trust the actual credit notification from my own banking app.

Conclusion

Looking back, this whole project really proved that being a tech student isn't just about knowing how to write code—it's also about how you communicate, work with others, and keep your data safe. Building out this portfolio forced me to think seriously about my digital footprint. Setting up my GitHub and LinkedIn has given me a great head start on my professional journey, and researching cybercrimes made me realize how careful we all need to be. I definitely feel a lot more confident navigating the digital side of college life now, and I'm ready to help my batchmates do the same.
